```
"""
3. Write a script to look at the title of each article and count the occurrences
of the three given words. For example, "ai", "compute”, and "invest". Then, create
a word frequency histogram.

Our script satisfies the criteria above by doing the following:
- reads the file produced by scrape_bing_news.py (one title per line)
- strips on-alpha characters from each title
- counts EXACT (whole-word) matches of our three keywords
- plots a word-frequency histogram
"""
